

***CUT** For printers with manual feed, cut sheets are fed manually through the manual feeder.

PV.source-drawer

Specify the drawer from which the paper is fed. Valid values range from 1 through 255. For printers with manual feed, specifying 100 is the same as specifying *CUT.

Output bin (OUTBIN)

Specifies the destination of the output on printers capable of multiple output bins. The possible values are:

***DEV**

The value specified in the Device description is used. *DEV is the default.

output bin

Specify the output bin for the destination of the output. Valid values range from 1 through 65535.

Copies (COPIES)

Specifies the number of copies to be printed.

The possible values are:

***PFD** Specifies that the number specified in the PFD definition is used.

This is the default value.

number-of-copies

Specify the number of copies to be printed.

The possible value range is 1 - 255.

Output queue (OUTQ)

Specifies the qualified name of the output queue in which the spooled file will be created.

The possible values are:

***JOB** Specifies the output queue specified in the job description associated with this job is used.

This is the default value.

output-queue-name

Specifies the name of the output queue to be used.

The possible library values are:

***LIBL** The library list is used to locate the output queue.

***CURLIB**

The current library for the job is used to locate the output queue. If no library is specified as the current library for the job, library QGPL is used.

library-name

Specify the library where the output queue is located.
